ILC Cryomodule Fabrication Strategy

ILC Cryomodule Fabrication Strategy

OUTLINE

- Goals
- Plans to Accomplish Goals
- Current Status of Work
- Overall Fabrication Strategy
- Conclusion

ILC Cryomodule Fabrication Strategy

Goals

- Goals are established and prioritized by FNAL SRFSC
- Primary goal is to fabricate sufficient ILC cryomodules within a given period to populate the SMTF
- FY05 goals shown on next slide

FY05 Goals Established by the FNAL SRFSC (in support of ILC & SMTF)

- 3.9 GHz Cavities
 - Complete six accelerating cavities
 - Continue deflecting cavity R&D
 - Complete single cavity A0 cryostat(s)
- Complete Capture Cavity #2
- Design & build Horizontal Test Cryostat (or Chechia vessel)
- Create infrastructure to support 1st U.S. built cryomodule construction in CY 06
- Complete joint FNAL/ANL BCP facility
- Begin 1.3 GHz cavity industrialization efforts

3.9 GHz Cavities & Cryostat(s): Work in Progress

- Design coldmass supports, both sliding and fixed
- Design coldmass and cryostat
- Main coupler design
- Helium vessel design complete but may need minor revision
- Helium supply pipe redesign (spacing & material)
- Heat Loads and cool-down analysis

Capture Cavity #2

Existing FNPL

Required for A0
 Photoinjector upgrade

Capture Cavity #2 Status

- Cryostat with poor performing 1.3GHz 9-cell cavity was received from DESY and has been disassembled
- •DESY to supply new high gradient replacement cavity and peripheral components which will be installed when they are received
- Engineering design work well underway
- •Scheduled for installation and commissioning at Meson Lab by September 2005, and ready for testing at Meson Lab

Horizontal Test Cryostat (Chechia)

- •Required for high power testing of single, dressed cavities
- •Our design will accommodate both 3.9GHz and 1.3GHz cavity testing

Horizontal Test Cryostat, cont.

1.3 GHZ Cavity

- Design work will be completed in FY05
- •Major components will be ordered early in FY06
- •Planned to be operational in Spring 2006

Support Infrastructure for 1st U.S. Built Cryomodule

- A 3-D model of the TTF 1.3 GHZ Cryo3 Vessel has been created.
- Preparation of americanized drawings is in progress (consistent with a CY06 deliverable).

Support Infrastructure for 1st U.S. Built Cryomodule: MP9 Cryomodule Assembly Facility Development

•A facility layout based on DESY's Hall 3 facility (below) is planned

TESLA TEST FACILITY (HALL 3)

Support Infrastructure for 1st U.S. Built Cryomodule: MP9 Cryomodule Assembly Facility Development

- Separator Work at MP9 ends this Fall
- •Building is sufficiently sized for R&D production quantities (1 per month)

MP9 Cryomodule Assembly Facility Development

FNAL Meson Area SM&TF Layout Concept

Joint FNAL/ANL BCP Facility

- •Design, construction, and test operation (using water) of FNAL system completed. System now disassembled and ready to be transported to ANL for installation in the newly constructed room inside Building 150.
- •FNAL safety review of system completed. A complete ANL safety review will be conducted once the system is installed there.
- •Design and construction of 3.9 GHz etching jackets almost complete.

 1.3GHz etching jacket design will commence once the 3.9GHz work is complete.
- Infrastructure tooling and fixturing development to support 3.9GHz and 1.3GHz cavity etching underway.
- Facility is scheduled for completion and initial operations by end of CY05

Overall Fabrication Strategy

- Infrastructure Development:
 - Utilize as much existing engineering designs for fixturing, tooling, processes and procedures to establish facilities at Fermilab as quickly as possible
 - Utilize existing facilities at
- Cavity Development:
 - Utilize available resources for cavities for first cryomodule (KEK, ACCEL, AES, DESY, et. al.)
 - Work with laboratories and universities (JLab, SLAC, Cornell, ANL, DESY, etc.) to develop cavity fabrication and processing capability and to develop processes and new techniques
- •Coupler Development:
 - Utilize available resources for couplers for first cryomodules (CPI)
 - Develop new, simpler designs with cost reduction and manufacturability as prime goals

Overall Fabrication Strategy (Cont.)

- •Cryomodule Development:
 - The first U.S. built cryomodule will be of the TESLA Type III design
 - The DESY supplied cryomodule "kit" will be of the TESLA Type III design
 - Type IV (ILC Prototype?) cryomodule development will proceed while the first two cryomodules are being assembled
- •Industrialization:

ILC Cryomodule Fabrication Strategy Conclusion

- •We are making very good progress on our FY05 goals
- •Infrastructure development to support 3.9GHz and 1.3GHz cryomodule fabrication is well underway.
- •"Deliverables" to the ILC GDE:
 - •Development of cavities that repeatably achieve 35MV/m accelerating gradient
 - •First U. S. cryomodule will be utilized for development of assembly techniques and infrastructure
 - Development of the next generation (Type IV) ILC Cryomodule
- •A strategic approach for cryomodule production and testing that makes use of existing capabilities within the national laboratories and universities has been presented
- •Industrialization is only beginning at this time. Initial efforts are with cavity manufacturing companies, both in the United States and in Europe.
